

Kodaikanal Observatory.

BULLETIN No. XXVI.

LIST OF PROMINENCES OBSERVED BETWEEN 1911, JULY 1 AND 1911, DECEMBER 31.

THIS list is a continuation of that published in Bulletin No. XXV, and contains all the prominences recorded both visually and photographically during the second half of 1911.

Remarks on the general distribution of the prominences with a diagram representing the mean profile areas for each zone of five degrees of latitude, and a review for the whole year, will be found on pages 499-500.

The methods of observation and the observers are the same as for the last list.

The following table shows the number of days on which observations were made:—

											Days.
Complete visual observations	95
Partial do do.	35
No do do.	54
Complete spectroheliograph records	124
Partial do.	30
No do.	30

N O T E S .

- 1911.
- July 1. Lat. — 80° 5' W. Bright. C was displaced to violet 1·0 Å. Changing. There was no prominence here, but there was a displacement to violet at 8^h 32^m.
 - August 2. Lat — 11° 5' E. The prominence was not seen at 8^h 24^m. Eruptive. It had disappeared at 9^h 11^m except for a small portion at the base. In Ca only a portion of the prominence 30" high was seen at lat. — 10° E.
 - 7. Lat. + 24° W. The prominence was surmounted in Ca by a detached cloud 4° broad and 100" high at 8^h 9^m. This cloud had disappeared in the photograph taken at 8^h 30^m.
 - 13. Lat. + 8° E. Bright Metallic. D₁, D₂, b₁, b₂, b₃, and b₄ were bright. Changing. F was displaced both ways slightly. The prominence was low at 8^h 40^m. In the Ca photographs it was a slender slanting streak 45" high
 - 26. Lat. — 79° E. An eruptive loop, faint and broader at the top. C was displaced to red throughout the prominence but most at the top the amount being 1·0 Å to red. The prominence was changing. Nothing was seen here in the Ca photographs.
 - 31. Lat + 7° E. Bright. Metallic. Showed displacement in C to violet 2·0 Å
 - September 6. Lat. — 40° E. Changing slightly in hydrogen. It was 3° broad and 50" high in Ca.
 - 8. Lat. + 31° 5' E. The prominence was broader in the middle but the top narrowed to a fine point. The stem was bright. In Ca it was 200" high and streaks from it met the limb at lats. + 34° E and + 25° E.
 - 13. Lat. — 36° 5' E. The prominence consisted of a slanting cloud connected to the limb by a narrow stem. There was a bright jet close to it at lat. — 37° 5' E. In Ca it was only 50" high.
 - 14. Lat. + 64° W. Eruptive. Showed displacement in C to red for about 3·0 Å. The prominence was not seen in the Ca photographs.
 - 30. Lat. + 8° E. Changing. Bright. Metallic. D₁, D₂, b₁, b₂, b₃, b₄, and 4924·1 were bright. 15" high at 8^h 40^m. C was slightly displaced to red. At 8^h 41^m displacement in F to red was 2·0 Å. The height of the prominence in Ca was 15".
 - October 2. Lat. + 36° 5' W. A Ca streak from the top extends on both sides and meets the limb at lats. + 31° and + 39° W.
 - 6. Lat. — 45° 5' E. The Ca prominence extends from lat. — 42° to — 52° E, and is 80" and 45" high.
 - November 2. Lat. — 15° W. Double 20" high in Ca. At 9^h 5^m it was bright and ringlike and 15" high in Ca
 - 8. Lat. + 68° W. Showed displacement to red in C about 2·5 Å. The prominence had disappeared at 8^h 42^m; but displacement of C to red continued.
 - 9. (1) Lat. — 7° W. Changing in Ca. At 9^h 11^m it was connected with the last prominence, and was 100" high at one place and 80" at another in Ca.
 - (2) Lat. + 17° 5' W. 150" high in Ca at 8^h 22^m. Increased in height to 180" at 9^h 11^m and decreased to 90" at 11^h 16^m in Ca.
 - 26. Lat. — 68° E. Bright. Metallic. Changing. D₁, D₂, b₁, b₂, b₃, b₄, 5316·8, and 4924·1 were bright.
 - 28. (1) Lat. — 51° W. At 8^h 53^m in Ca a clouded float slanting to — 4° W. over this bank of prominences at a height of 150" with a fine thread-like streak almost meeting the bank. At 9^h 18^m it was 165" high. At 9^h 54^m it was 200" high but it was connected to the bank by the slender streak. At 10^h 22^m it was 240" high and there was no change in form. At 10^h 35^m it was an arch 240" high floating over the north end of the bank, and unconnected with it. The summit of the arch was thicker. In all the photographs there was little change in the bank itself.

1911.

November 28—(2) Lat. — 2° W. A bright eruptive cloud connected to the limb at two points. Changing
contd.

Metallic. C was displaced 1 \AA to red at $9^{\text{h}} 9^{\text{m}}$. D₁, D₂, b₁, b₂, b₃, b₄, 5316·8,
 and 4924·1 were bright. Changed completely at $9^{\text{h}} 19^{\text{m}}$ the form at this time
 resembled that shown on the Ca photographs 30" high in Ca. Nothing was seen
 in Ca at $9^{\text{h}} 18^{\text{m}}$.

30. Lat. — 23° E. Ca. The prominence was surmounted by a detached changing cloud the base
 of which was 1' above the limb, and the summit 4' 30". At $9^{\text{h}} 37^{\text{m}}$ it had increased its
 distance from the limb and was 5' 30" in height the base being 2' above the limb. At
 $10^{\text{h}} 31^{\text{m}}$ it consisted of two parallel vertical streaks the lower ends being 3' and the
 summit of the larger streak 7'30" above the limb. During these changes the prominence
 drifted 3° or 4° towards the north.

December 4. Lat. — 12° W. A detached cloud in hydrogen. Changing in Ca. In the photographs
 taken at $9^{\text{h}} 59^{\text{m}}$ and at $11^{\text{h}} 0^{\text{m}}$ it was connected to the limb and was 60" and 80" in height
 in the respective plates; but in the photograph taken at $10^{\text{h}} 21^{\text{m}}$ it had changed in form
 and had become detached from the limb.

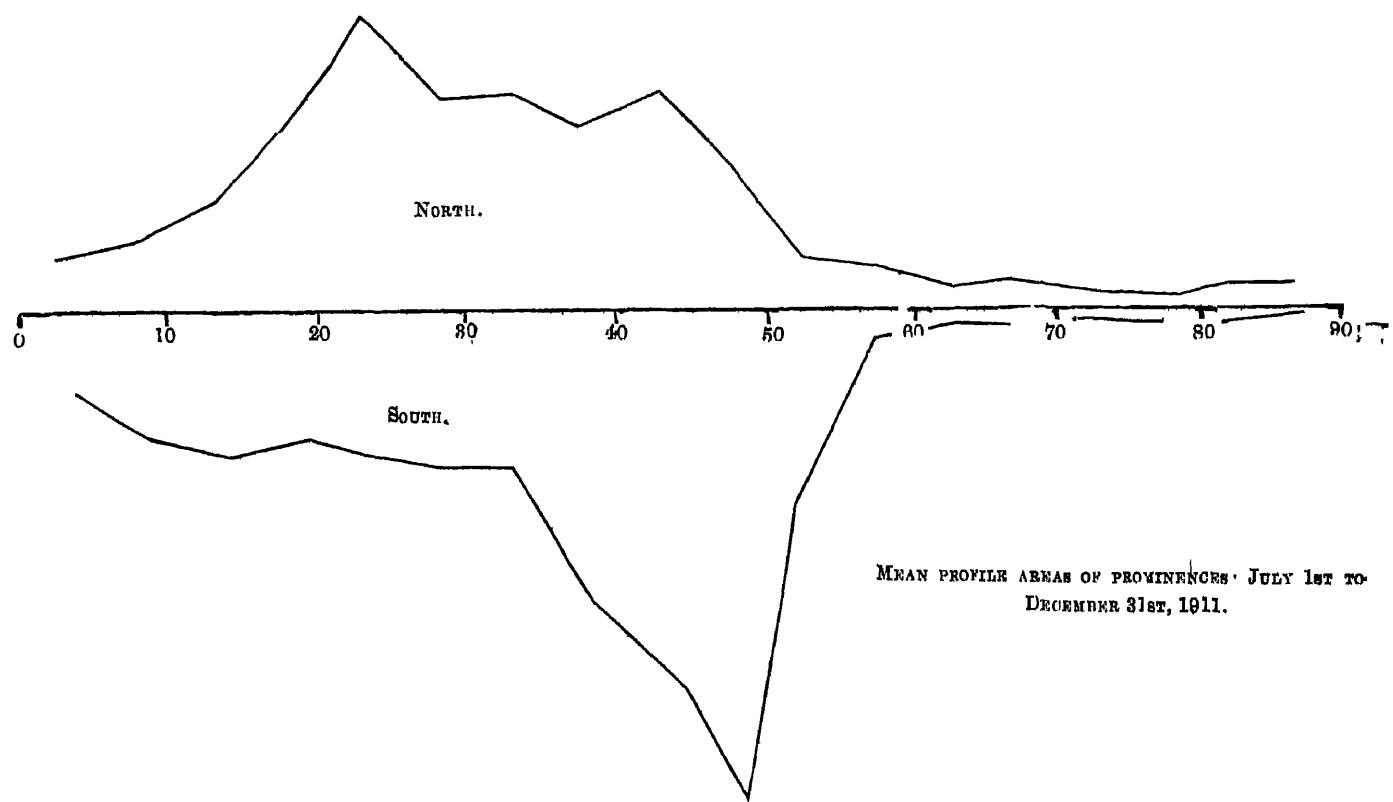

27. Lat. — 39° E. 9° broad in Ca and was surmounted by a detached cloud 125" high at $10^{\text{h}} 45^{\text{m}}$.
 At $11^{\text{h}} 44^{\text{m}}$ this cloud was connected to the limb at lat. — 37° E and was 145" high.

29. (1) Lat. — 50° W. Bright. Metallic. D₁, D₂, b₁, b₂, b₃, and b₄ were bright. It was only
 30" high in Ca.

(2) Lat. — $16^{\circ} 5$ W. Very bright. Metallic. The whole prominence was visible in D₁, D₂,
 b₁, b₂, b₃, and b₄. The lines 6677, 5316·8, and 4924·1 were bright. The prominence
 was only 3° broad 15" high in Ca.

REMARKS ON THE DISTRIBUTION OF THE PROMINENCES DURING THE
SECOND HALF OF 1911 WITH A GENERAL REVIEW
FOR THE WHOLE YEAR.

The general features of prominence distribution during the six months ending December 31, 1911, are shown in the accompanying diagram which represents graphically the mean profile areas found for each zone of five degrees in latitude --

The distribution is similar to that shown during the first six months of the year and differs only in the development of specially active zones between the parallels of 40° and 50° in the southern hemisphere and between 20° and 25° in the northern. The mean total area for the northern hemisphere remains practically the same as during the earlier months, whilst the mean for the southern hemisphere shows an increase of 10 per cent. due to the marked development of prominences between 40° and 50° .

The prominence activity for the whole year shows a diminution compared with the previous year. The mean profile area was 29 per cent. less and the mean frequency 6 per cent. less, the mean size of the prominences having diminished more than their mean numbers.

These figures show that the prominence activity is to a large extent independent of the spot activity which has fallen during 1911 to about one-third its value in 1910.

In the following tables the mean areas and mean frequencies are compared with the year 1910:—
Mean profile areas of Prominences in square minutes of arc —

		1910.	1911.
		Per diem.	Per diem.
North	..	2·03	1·27
South	..	2·07	1·64
	Total	<u>4·10</u>	<u>2·91</u>

Mean frequencies of Prominences —

		1910.	1911.
		Per diem.	Per diem.
North	..	11·1	10·2
South	..	11·0	10·7
Equator	..	0·2	0·1
	Total	<u>22·3</u>	<u>21·0</u>

The mean height shows a very slight increase being 27·1 in 1911 against 26·8 in 1910.

In forming these tables an approximate allowance is made for partial or imperfect observations and the mean frequencies are therefore very slightly greater than those given in the detailed abstract which follows in which the numbers observed are divided by the total number of days of observation.

Metallic prominences were very infrequent only 24 being recorded during the year. Most of these were found in the sunspot zones but, as in the previous year, a few were observed in high latitudes. The mean and extreme latitudes are given in the following table:—

		Number observed.	Mean latitude.	Extreme latitudes.	
North	..	9	21° 5'	0° 5'	86° 5'
South	..	15	28° 8'	2° 0'	71° 5'

Displacements of the hydrogen lines were observed in prominences or in the chromosphere on 86 occasions. In 40 of these the displacement was towards the red and in 41 towards the blue; the remaining 5 showed displacements in both directions.

These disturbances were observed in all latitudes from the equator to the poles and they were much more frequent in the southern hemisphere than in the northern. It is noteworthy that a very large proportion occurred within the polar areas where the larger prominences were absent.

The most interesting prominence recorded during the year was observed on April 2 in south latitude 34°; successive photographs showed an accelerating motion of ascent increasing from 30 to 84 kilometers per second; and a final break up of the prominence into scattered fragments one of which attained the enormous height of 10' of arc or 435,000 kilometers above the sun's limb.
