BULLETIN No. LXI.

## SUMMARY OF PROMINENCE OBSERVATIONS FOR THE FIRST HALF OF THE YEAR 1919.

The distribution of prominences observed and photographed during the half-year ending June 30th, 1919, is represented in the following diagram, in which the full line gives the mean daily areas and the broken line the mean daily numbers for each zone of  $5^{\circ}$  of latitude. The ordinates represent tenths of a square minute of arc for the full line and numbers for the broken line. The means are corrected for incomplete or imperfect observations, the total of 174 days being reduced to 159 effective days.

The distribution in the southern hemisphere has been almost identically the same as during the latter half of 1918, the only notable change indicated being the suppression of a feeble activity near the south pole which was maintained until the end of 1918. In the north there has been a transfer of activity from the zone  $25^{\circ}$ — $35^{\circ}$  to  $35^{\circ}$ — $45^{\circ}$ , and a considerable increase between the equator and latitude  $20^{\circ}$ .

The mean daily areas and numbers corrected for imperfect observations are given below:—

				Mean daily areas (square minutes)	Mean daily numbers
North	...	...	...	1.55	6.86
South	...	...	...	1.81	6.78
			Total	3.36	13.64

This indicates for areas a slight increase in the northern hemisphere and a decrease in the south compared with the previous half year. For numbers there is a general decrease amounting to 15 per cent. The excess of area in the south noted in 1918 has been maintained although numbers are nearly equally divided between north and south. The southern prominences were on the average slightly brighter than the northern.

The monthly, quarterly, and half-yearly areas and numbers, and the mean height and extent of the prominences are given in table I. The unit of area is 1 square minute of arc.

TABLE I.—ABSTRACT FOR THE FIRST HALF OF 1919.

Month	Number (effective)	Areas.	Numbers	Daily Means		Mean height. "	Mean extent. °
				Areas.	Numbers		
January	29	87.7	467	3.02	16.1	30.6	2.58
February	28	96.8	434	3.46	15.5	28.1	2.68
March	30	110.9	458	3.69	15.3	27.8	2.82
April	26	98.0	316	3.77	12.2	32.5	3.55
May	25	84.8	264	3.39	10.6	26.1	3.56
June	21	56.1	230	2.66	11.0	27.9	3.29
First quarter	87	295.4	1359	3.39	15.6	28.9	2.68
Second quarter	72	238.9	810	3.32	11.3	29.1	3.48
First half-year	159	534.3	2169	3.36	13.6	29.0	2.99

This table has been modified by the inclusion of prominence areas, and the suppression of a column giving the total number of days of observation. It is considered that the mean monthly areas will give a truer index of the prominence activity than the mean numbers. Although the mean areas of prominences show a very slight increase, there has been a general decrease in mean numbers, height, and extent on the limb compared with the last half of 1918.

A prominence remarkable for its size was photographed on May 28 and 29 extending over 40 degrees of the south-eastern limb, between latitude  $-10^{\circ}$  and  $-50^{\circ}$ , and covering an area of 12 square minutes. The prominence became partially separated from the limb on the 29th and the main portion ascended slowly and became dissipated in space between  $16^{\text{h}} 33^{\text{m}}$  I.S.T. ( $11^{\text{h}} 03^{\text{m}}$  G.C.T.), on the 29th and  $7^{\text{h}} 44^{\text{m}}$  I.S.T. ( $2^{\text{h}} 14^{\text{m}}$  G.C.T.), on the 30th. This was the final stage of an apparently stable prominence which had been recorded as an absorption marking early in the month, crossing the central meridian on May 9 and appearing on the western limb between latitude  $-15^{\circ}$  and  $-43^{\circ}$  on May 16.

#### *Distribution east and west of the sun's axis.*

The distribution of the prominences east and west of the sun's axis is similar to that observed in the previous half year, areas showing an eastern preponderance and numbers a western. The figures are given in the table below:—

1919 January to June	East.	West	Percentage east
Total number observed	1088	1131	47.85
Total areas in square minutes	233.9	250.5	53.13

There is no marked difference in the mean brightness of eastern or western prominences.

*Metallic Prominences.*

An unusual number of metallic prominences was recorded during the half year, the total being 121, whilst during the whole of 1918 only 65 were observed. This large increase may be in part due to increased vigilance in searching for bright lines in prominences, but there seems to be no doubt that the sun has been more active than usual in the eruption of metallic vapours characteristic of the lower chromosphere. The sodium magnesium and enhanced lines of iron have usually been observed but several other iron lines have also been noted together with a few lines of chromium and titanium, and the barium line 4934.2.

It may be noted that the occurrence of a large number of metallic prominences synchronises with a period of great magnetic activity as recorded by the Observatory magnetographs.

Details of the metallic prominences are given in the following table :—

TABLE II.—LIST OF METALLIC PROMINENCES OBSERVED AT KODAIKANAL, JANUARY TO JUNE 1919.

Date	Hour I.S.T.	Base	Latitude		Limb	Height	Lines.

The metallic prominences recorded above were distributed in latitude as follows:—

	1° to 30°.	31° to 60°.	61° to 90°.	Mean latitude.	Extreme latitudes.
North South Equator	58 40 1	3 11 ...	2 6 .	16·6 27·6	1°, 71·5 1, 85

Sixty-nine were in the eastern limb or 57 per cent of the whole.

*Displacements of the hydrogen lines.*

Particulars of the displacements observed in the chromosphere and prominences are given in the following table —

TABLE III.

	29	8 29		2.5	W			
	30	8 27		64	E			
	30	8 27	64		W	Slight		

The total number of displacements was 473, of which 2 were on the equator, and the rest were distributed as follows :—

Latitude	North.	South.
1° to 30°	..	...
31° to 60°	...	...
61° to 90°	...	...
	Total	253 218
East limb	...	238
West limb	...	231
Pole	...	1

There were 276 displacements towards red and 227 towards violet. These include 49 occasions in which the displacement was to red and to violet in different parts of the same prominence. 19 of the displacements were both ways simultaneously.

#### *Reversals and displacements on the disc.*

185 bright reversals of the H $\alpha$  line, 43 dark reversals of the D $_3$  line and 96 displacements of the H $\alpha$  line were recorded. They were distributed as follows :—

	North.	South.	East.	West
Bright reversals of H $\alpha$	...	..	110	75 102 83
Dark reversals of D $_3$	...	..	22	21 28 15
Displacements of H $\alpha$	...	..	57	39 41 55

All these figures are in excess as compared with the previous half year. 71 of the displacements were towards red, 19 towards violet and 6 both ways simultaneously.

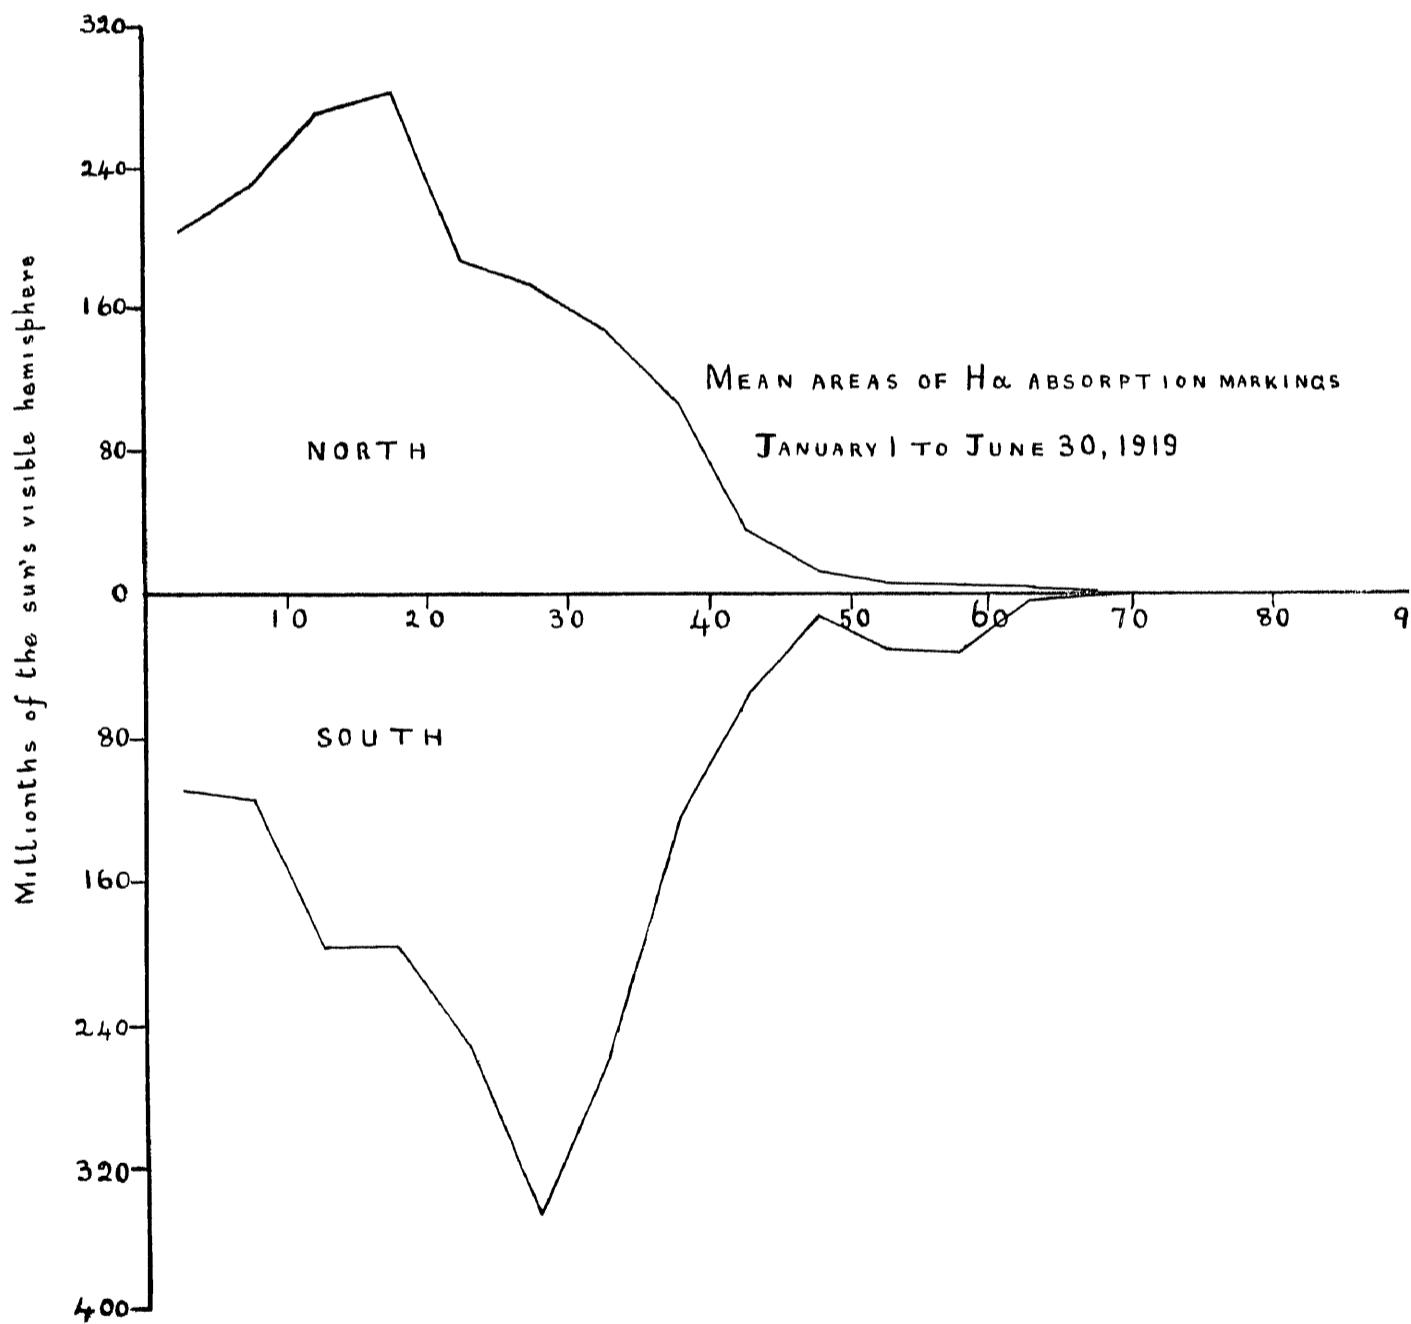

*Prominences projected on the disc as absorption markings.*

Photographs of the sun's disc in H $\alpha$  light were obtained on 141 days counted as 132 effective days. The mean daily areas in millionths of the sun's visible hemisphere, corrected for foreshortening, and the mean daily numbers are given below :—

		Areas.	Numbers
North	... .. .. .. .. .. .. .. ..	1668	10.0
South	... .. .. .. .. .. .. .. ..	1734	10.8
	Total ..	<u>3402</u>	<u>20.8</u>

Both areas and numbers show an increase in the northern hemisphere, and a decrease in the south compared with 1918, as is shown also by the prominences at the limb. The total areas are slightly greater and numbers slightly less than were obtained for the previous half year ; this also is in agreement with the results for prominences at the limb.

The distribution of the absorption markings in latitude is shown in the accompanying diagram.

As in the case of prominences at the limb, the region of maximum activity shows a tendency to move towards the equator, more rapidly in the northern hemisphere than in the southern.

For the first time since 1916 the percentage of areas in the eastern hemisphere (49·25 per cent) is less than in the western. In the case of numbers the eastern percentage is 50·29.

KODAIKANAL OBSERVATORY,  
12th August 1919.
