

Kodaikanal Observatory

BULLETIN No. CXXXII.

PART I

SUMMARY OF PROMINENCE OBSERVATIONS FOR THE FIRST HALF OF 1950

This bulletin embodies the results of observations of prominences made at Kodaikanal Observatory during the first half of 1950, supplemented by data from other foreign observatories for those days on which Kodaikanal had imperfect or no photographs. We take this opportunity to thank the Observatories at Mt. Wilson and Meudon who have been kind enough to send their spectroheliograms for the missing days.

K Prominences at the limb.—During the half-year under review, photographs of calcium prominences at the limb were obtained at Kodaikanal on 152 days, of which the plates for 145 days were utilised for the computations; the Observatories at Mt. Wilson and Meudon each supplied spectroheliograms for 25 days. In all, the records were complete for 177 days during the half year and these were counted as 168½ effective days after giving due weightage for the quality of the photographs.

The mean daily areas (in sq. minutes of arc) and the mean daily numbers derived from all the above records are given below :—

| | . | . | . | . | . | . | Combined data | |
|-------|---|---|---|---|---|---|--------------------------------|--------------------|
| | | | | | | | Mean daily areas (sq. minutes) | Mean daily numbers |
| North | . | . | . | . | . | . | 1.70 | 4.69 |
| South | . | . | . | . | . | . | 1.11 | 3.39 |
| Total | . | | | | | | 2.81 | 8.08 |

The above figures show that compared to the previous half year there has been a decrease in both areas and numbers, the decrease being 34% in areas and 15% in numbers. The southern hemisphere was generally less active than the north as in the previous half year.

MISPOK

Price . Rs. 7/8/- or 12sh 6d

For comparison with the data published in bulletins prior to 1923, i.e., before the co-operation of other observatories came into force, the values based on Kodaikanal observations alone are also given below :—

| | Kodaikanal data only | |
|-------|----------------------------------|--------------------|
| | Mean daily areas (sq minutes) | Mean daily numbers |
| North | 1.71 | 4.96 |
| South | 1.07 | 3.47 |
| Total | 2.78 | 8.43 |

The distribution of areas and numbers in 5° ranges of latitude is represented in the following diagram.

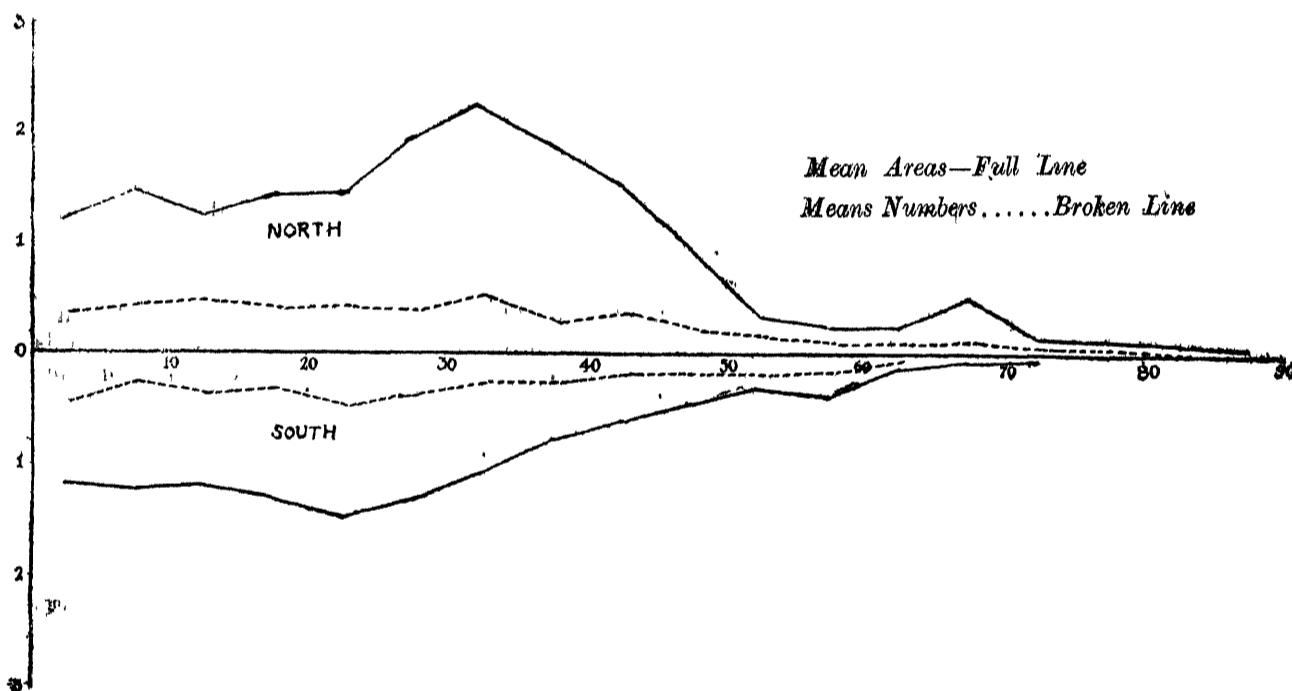

Fig 1. Mean Areas and Mean Numbers of Calcium Prominences (January 1 to June 30)

The most pronounced activity of prominences, as judged from areas, is centred in latitudes 30° — 35° N and 20° — 25° S. This represents an equatorial drift of the peaks of activity by 10° as compared with the previous half-year. The small high latitude maximum in the north has remained stationary at 65° — 70° as in the last half-year.

The monthly, quarterly and half-yearly areas, numbers, heights and extents of prominences as obtained from photographs of all the three observatories are shown in the following table :—

TABLE I

| Months | Number of days (effective) | Areas (sq. mins.) | Numbers | Daily means | | Mean height * | Mean extent ? |
|-----------------------------|----------------------------------|-------------------------|---------|--------------------|---------|---------------------|---------------------|
| | | | | Areas (sq. mm.) | Numbers | | |
| 1950 | | | | | | | |
| January | 27½ | 87·3 | 232 | 3·20 | 8·51 | 38·90 | 5·02 |
| February | 26½ | 74·9 | 198 | 2·80 | 7·40 | 41·40 | 4·48 |
| March | 28½ | 84·0 | 250 | 2·95 | 8·77 | 42·08 | 3·46 |
| April | 28½ | 63·55 | 251 | 2·25 | 8·89 | 37·61 | 3·23 |
| May | 28½ | 75·35 | 221 | 2·62 | 7·69 | 38·03 | 4·38 |
| June | 29 | 89·15 | 211 | 3·07 | 7·28 | 46·23 | 4·69 |
| 1st Quarter | 82½ | 246·2 | 680 | 2·98 | 8·24 | 40·82 | 4·29 |
| 2nd Quarter | 86 | 228·05 | 683 | 2·65 | 7·94 | 40·41 | 4·05 |
| 1st half-year | 168½ | 474·25 | 1363 | 2·81 | 8·09 | 40·62 | 4·13 |

The following table gives the distribution of prominences east and west of the sun's axis :—

| 1950 January—June | | | | | | | East | West | Percentage East |
|---|--|--|--|--|--|--|--------|-------|--------------------|
| Total areas (sq. minutes) | | | | | | | 223·25 | 261·0 | 47·17 |
| Total numbers | | | | | | | 625 | 738 | 45·85 |

The eastern defect in both the areas and the numbers persists as in the previous half-year ; the defect is more pronounced in the case of numbers.

Observations with the Prominence Spectroscope

Metallic Prominences.—Eleven metallic prominences were observed during the period under review ; their details are given in the table below :—

| Date 1950 | Time I.S.T. | Base ° | Latitudes | | Limb | Height in Hz (seconds of arc) | Lines in which observed | Remarks |
|--------------|----------------|-----------|-----------|-------|------|--|----------------------------|--|
| | | | North | South | | | | |
| January | h m. | 2 | 31 | | E | 22·4 | D's, b's and 6677 | Ht. in D's=17·6". Ht. in b's=18·4". |
| | 08 40 | | | | | | | |
| | 10 25 | .. | 12 | | E | Not measured | Do. | Ht. in D's and b's too small to measure. |
| February | | | | | | "Nil" | | |

| Date 1930 | Time L.S.T. | Base | Latitudes | | Limb | Height at H ₂ (seconds of arc) | Lines in which observed | Remarks |
|--------------|----------------|------|-----------|-------|------|--|------------------------------------|---|
| | | | North | South | | | | |
| March | | | | | | | | |
| 13 | 10 00 | 0 | 20 | | E | 32 | D's, b's and 6677 | Ht. in D's and b's too small to measure. |
| 15 | 09 30 | 0 | 30 | | W | 40 | Seen in all the 12 metallic lines. | Do. |
| | 10 00 | 23 | 17 | | E | 40 | D's & b's | Ht. in D's=28".0". Ht. in b's=32".0". |
| 16 | 09 00 | 0 | 18 | | W | 80 | | Ht. in D's and b's too small for measurement. |
| 18 | 09 00 | 1 | 25 | | E | 44 | | Ht. in D's=28".0". Ht. in b's=28".0". |
| 20 | 09 05 | 0 | 18 | | E | 76 | | Ht. in D's and b's too small for measurement. |
| April | | | | | | | | |
| 13 | 08 45 | 1 | 29.5 | | E | 46.4 | Do. | Do. |
| May | | | | | | | | |
| 8 | 09 05 | 1 | 29.5 | | E | 14.4 | D's only | Ht. in D's too small for measurement |
| 16 | 09 20 | 0 | 20 | | W | Speck-Ht. too short to measure | D's, b's & 6677 | Ht. in D's and b's too small for measurement. |
| June | | | | | | | | |
| | | | | | | "NIL" | | |

NOTE.—The key to the wave-lengths of the metallic lines is given below —

| No. | λ | Element | No. | λ | Element |
|-----|---|---------|-----|---------------------------------|---------|
| 1 | 4924.1 | Fe+ | 7 | 5276.2 | Fe+ |
| 2 | 5016.0 | He | 8 | 5316.8 | Fe+ |
| 3 | 5018.6 | Fe | 9 | 5363.0 | Fe+ |
| 4 | b ₄ , b ₃ , b ₂ , b ₁ | Mg, Fe+ | 10 | D ₁ , D ₂ | Na |
| 5 | 5234.8 | Fe | 11 | 6677 | He |
| 6 | 5276.0 | Cr | 12 | 7065 | He |

The metallic prominences were distributed as follows :—

| Latitudinal zone | 1°—10° | 11°—20° | 21°—30° | 31°—40° | Mean latitude | Extreme latitudes |
|------------------|--------|---------|---------|---------|------------------|----------------------|
| North | .. | .. | 6 | 4 | 1 | 22°.8 |
| South | .. | .. | .. | .. | .. | 12° and 31° |

Doppler displacements of 'C' line in the chromosphere and prominence.

Particulars of Doppler shifts observed in the chromosphere and the prominences with the spectroscope are collected in table III.

TABLE III¹

| Date & month | Time I S T (GMT. +05 h. 30m) | Mean latitude | | Limb | Displacements | | Remarks |

| | | | | | Nil | | |

In all, displacements were recorded on 43 occasions as against 17 in the previous half-year. The distribution of these displacements was as follows :—

| Latitude | North | South | Total |
|-----------|-------|-------|-------|
| 0—30 | 23 | 10 | 33 |
| 31—60 | 7 | 2 | 9 |
| 61—90 | 1 | .. | 1 |
| Total | 31 | 12 | 43 |
| East limb | | 23 | |
| West limb | | 20 | |

12 of these displacements were towards red, 11 towards violet and the remaining in both directions simultaneously.

A large eruptive prominence was observed on February 3 at a mean latitude of 2.5° south extending over 32° on the west limb and covering an area of about 8 square minutes of arc. (This prominence was seen as a long dark marking on the hydrogen spectroheliograms taken from January 22). The prominence showed large Doppler displacements before it erupted. A series of photographs were secured from 0907 hrs. I. S. T. to 1,427 hrs. I. S. T. during the different phases of the eruption. The maximum height reached by the prominence as recorded on the K spectroheliogram taken at 1112 hrs. I. S. T. was 630 seconds of arc or nearly 2,85,000 miles.

Reversals and displacements on the sun's disc.

The H-alpha line was observed in emission on the disc in the vicinity of spots on 36 occasions and the D₃ line in absorption on 27 occasions. 3 displacements of the H-alpha line were also recorded on the disc near spot regions. The distribution of these reversals and displacements was as shown below:—

| | North | South | East | West | Total |
|---|-------|-------|------|------|-------|
| Bright reversals of H-alpha line on the disc | 26 | 10 | 28 | 8 | 36 |
| Dark reversals of D ₃ line on the disc | 19 | 8 | 21 | 6 | 27 |
| Displacements of H-alpha line on the disc | 2 | 1 | 1 | 2 | 3 |

Observations of Heights of prominences in H_α, D₃ and H_β lines.

Systematic visual observations of the heights of conspicuous prominences in the H-alpha, D₃ and H_β lines were begun with the prominence spectroscope from May 1947. The values thus obtained were compared with the heights of the same prominences measured on the K spectroheliograms. The following table gives details of these observations made up to the end of the first half of 1950.

| Year | Period | Total No. of prominences whose heights were measured in H _α , D ₃ and H _β lines | Mean heights | | | |
|----------|-------------------------|--|----------------|----------------|----------------|----------------|
| | | | C _a | H _α | D ₃ | H _β |
| 1947 | May—June | 55 | 63.4 | 54.4 | 47.5 | 39.9 |
| | July—December | 114 | 70.5 | 60.7 | 52.6 | 48.6 |
| | Whole year | 169 | 68.2 | 59.3 | 50.9 | 46.4 |
| 1948 | January—June | 171 | 53.9 | 50.4 | 47.3 | 41.1 |
| | July—December | 159 | 52.6 | 45.0 | 37.9 | 35.7 |
| | Whole year | 330 | 53.3 | 47.8 | 42.8 | 38.5 |
| 1949 | January—June | 151 | 64.4 | 60.8 | 57.0 | 52.3 |
| | July—December | 77 | 51.3 | 47.1 | 43.7 | 40.4 |
| | Whole year | 228 | 60.0 | 56.1 | 52.5 | 48.3 |
| 1950 - - | January—June | 65 | 61.2 | 61.4 | 57.9 | 53.2 |

Observations with the Hale Spectrohelioscope.

Details of observations of the Doppler displacements of the H-alpha line over prominences and dark markings made with the spectrohelioscope are given below :—

| | North | South | East | West | Total |
|--------------------------------|-------|--------|----------|------|-------|
| Displacements in prominences | 20 | 11 | 21 | 10 | 31 |
| Displacements in dark markings | 14 | 5 | 10 | 9 | 19 |
| Displacements towards | | | | | |
| | Red | Violet | Bothways | | |
| In prominences | 7 | 4 | | 20 | |
| In dark markings | 5 | 6 | | 8 | |

Particulars of solar flares observed with the spectrohelioscope during the period under review are given in the following table :—

TABLE IV.

| Date | Time in I. S. T. | | | Latitude | Longitude from C.M. | Intensity | Maximum width of H-alpha Line |
|-----------------|------------------|---------|-------|----------|---------------------|-----------|-------------------------------|
| | Beginning | Maximum | End | | | | |

| <i>June</i> | 5 | | 08 25 | 08 33 | +6 | 40 W | 1 |
| | | | | | | | 1.8 |

Details of H-alpha dark markings and prominences whose sudden disappearances within an interval of 24 hours or less were observed are summarised below :—

| Nature of phenomenon | Date and time of phenomenon when last seen | I. S. T. | Co-ordinates of phenomenon when last seen | |
|------------------------------|--|----------|---|--------------------------|
| | | | Mean latitude | Mean longitude from C.M. |
| | | H. M. | ° | ° |
| <i>H-alpha dark markings</i> | January 6 | 11 30 | (a) 32 N (b) 36 N | 7 W 22 W |
| | March 26 | 11 30 | 42 N | 12 E |
| | April 11 | 11 30 | 39 S | 21 W |
| | April 14 | 11 10 | 37½ N | 10 E |
| | April 18 | 11 30 | 27 N | 2 E |
| | June 20 | 11 30 | 26 N | 31 E |

| Nature of Phenomenon | Date and time of phenomenon Time when last seen | | Co-ordinates of Phenomenon when last seen | |
|----------------------|---|-----------|---|---------|
| | (I. S. T.) | | Mean Latitude | Limb |
| Prominences | January 11 | | 15 15 | 54 N E |
| | January 21 | | 07 45 | 20 N E |
| | February 2 | | 08 00 | 25½ N W |
| | February 3 | | 07 45 | 2½ S W |
| | April 19 | | 11 30 | 16½ N E |
| | May 18 | | 14 26 | 33½ N W |
| | May 19 | | 11 00 | 13½ S E |

Prominences projected on the disc as H-alpha absorption markings.

During the period under review, photographs of the Sun's disc in the H-alpha line were obtained at Kodaikanal on 159 days, of which the plates on 5 days were rejected due to their poor quality. Spectroheliograms were also received for 23 days from the Mt. Wilson Observatory and for 17 days from the Meudon Observatory. The records were thus available for 178 days of the half-year and these were reckoned as 172½ effective days after necessary weightage being given to the quality of the photographs.

The mean daily areas (in millionths of the Sun's visible hemisphere uncorrected for foreshortening) and the mean daily numbers of the H-alpha dark markings as derived from these photographs are given below :—

| | Combined data | |
|-------|--|--------------------|
| | Mean daily areas. (millionths of the sun's visible hemisphere) | Mean daily numbers |
| North | 2425·2 | 18·72 |
| South | 1542·2 | 13·63 |
| Total | 3967·4 | 32·35 |

The above values indicate that there has been a decrease in both the areas and the numbers (similar to the trend shown by prominences on the limb), the decrease in areas being 13% and that in numbers 14%, as compared with the corresponding values of the previous half-year.

The figures based solely on Kodaikanal photographs are also given in order to facilitate comparison with the data published in Bulletins prior to 1923.

| | Kodaikanal data only | |
|-------|---|--------------------|
| | Mean daily areas. (millionths of the sun's visi- ble hemisphere) | Mean daily numbers |
| North | 2284·7 | 17·59 |
| South | 1434·3 | 12·57 |
| Total | 3719·0 | 30·16 |

The distribution of the areas of the markings in latitude is represented in the following diagram :—

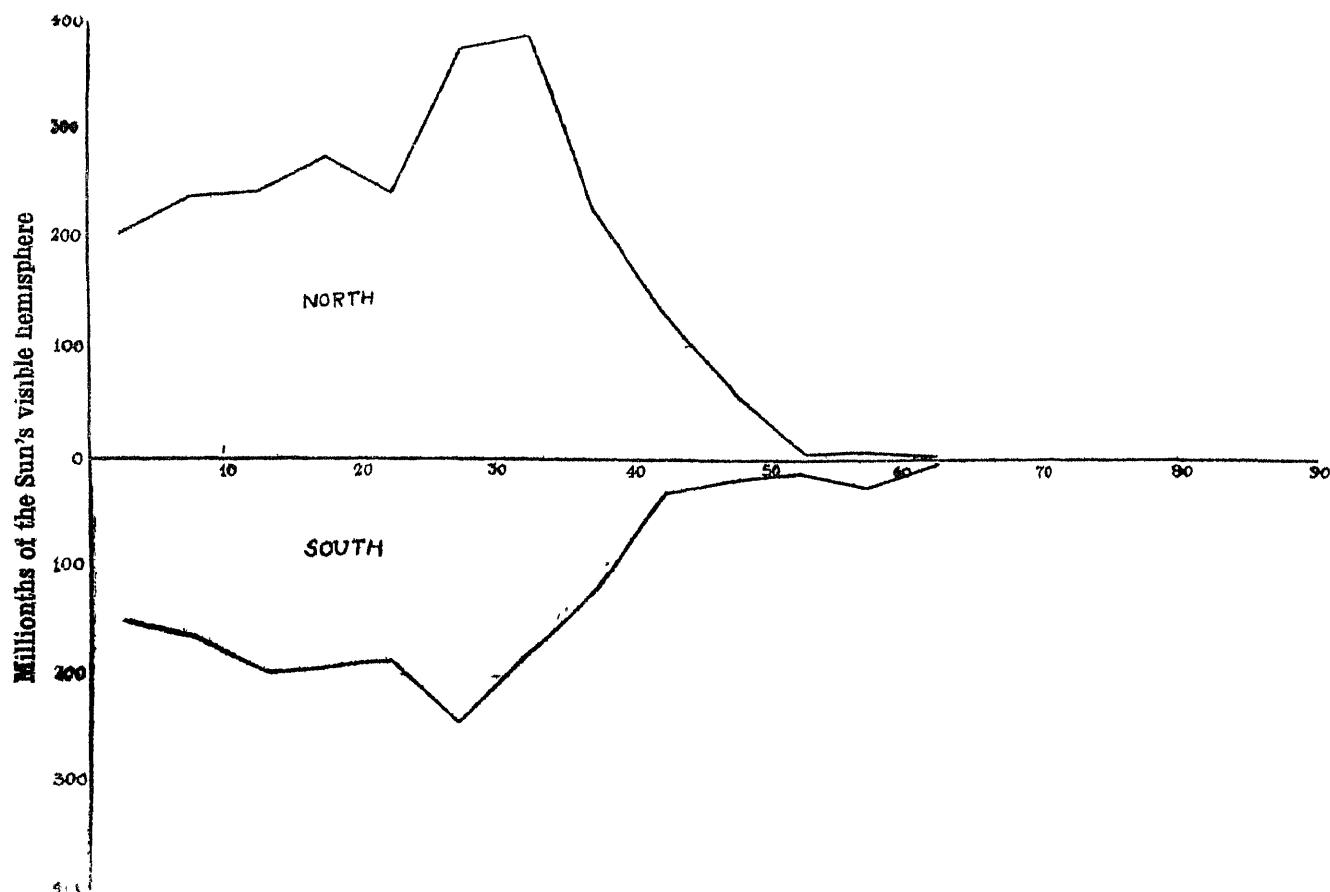

Fig. 2 Mean Areas of $H\alpha$ Absorption Markings (January 1 to June 30, 1950.)

The zones of maximum activity of the absorption markings are centred in latitudes 25° — 35° N and 25° — 30° S, indicating a poleward shift of the peaks of activity by 5° from the positions in the previous half-year.

The distribution of areas and numbers of the dark markings about the Sun's axis is indicated below :—

| January—June 1950 | East | West | Percentage East |
|--|--------|--------|--------------------|
| Total areas (Millionths of the Sun's visible hemisphere) | 329296 | 355048 | 48.12 |
| Total numbers | 2750 | 2830 | 49.45 |

The eastern defect in both the areas and the numbers still exists as in the last half-year, but the defect is slightly less.

PART II

SUMMARY OF MAGNETIC OBSERVATIONS FOR THE FIRST HALF OF 1950

Introduction

Beginning from this bulletin the results of magnetic observations made at the Kodaikanal Observatory will be included in the half-yearly bulletins of the observatory which have hitherto contained only solar data. A brief history of the magnetic observatory, the instruments and the system of observation is given below.

The Kodaikanal Magnetic Observatory is situated in the grounds of the astronomical observatory at latitude $10^{\circ}14' N$ and longitude $77^{\circ}28' E$ at an elevation of about 7,620 ft. above mean sea level. Kodaikanal was selected as one of the five base stations for the magnetic survey of India and a magnetic observatory was started at this station in 1902. Till 1916 the magnetic observatory functioned under the control of the Survey of India with its headquarters at Dehra Dun. In 1916 the observatory was placed under the control of the Director, Solar Physics Observatory, for better supervision of work. The observatory was, however, closed down on 1st October 1923 as the Survey of India no longer required the observations. The magnetic data collected during the period 1902 to 1923 have been published in Volumes 1 to 19 of the "Records of Survey of India."

In view of the growing importance of geomagnetic observations in relation to solar phenomena and because of the proximity of Kodaikanal to the magnetic equator, the magnetic observatory was restarted in January 1949 as part of the post-war development programme of the Kodaikanal Observatory. The buildings of the old magnetic observatory were almost intact and were repaired to house the instruments of the new magnetic observatory.

Location ---The observatory is built on the western slope of the hill on which the old domes and offices of the astronomical observatory stand and is about 70 feet below the floor level of the domes. The variometers are installed in an underground room, $15' \times 20'$, with very thick walls which are surrounded on all sides by a 3' wide passage. The thermal insulation of the variometer room is therefore very efficient. Supported on the thick, arched roof of the variometer room is a wooden hut which houses the instruments of absolute measurements. A masonry pillar, about 300 yards to the north of the building, carries a reference mark for declination observations.

Instruments :—The new observatory started with the old instruments which were in use before 1923; they were renovated and put into commission. These consist of :—

- (1) H.F., V.F. and Declination Magnetographs of Watson type ;
- (2) Kew Magnetometer No. 3 with a pair of magnets for absolute measurements of H and D ;
- (3) Wild pattern Earth Inductor No. 46 by Schulze, Potsdam ;
- (4) Galvanometer No. 203 by Flath, Potsdam.

The variometers are installed on isolated pillars in the underground room in precisely the same way as they were in the old magnetic observatory. A full description of these instruments and their mounting is given in the records of the Survey of India Vol. XIX (1901—20). The data incorporated in the present summary are derived entirely from the records of these instruments. However, a set of La Cour variometers has recently been added to the equipment of the observatory; these have been installed in the variometer room by the side of the Watson magnetographs and systematic records are being made with these instruments since June 1951.

Determination of absolute values :—

- (1) Absolute observations of H. F. are made once every week (on Wednesdays) with Kew Magnetometer No. 3.
- (2) Absolute observations of declination are made once a week (on every Thursday) with the same instrument.
- (3) Observations of inclination are made with the earth inductor on all days excepting Saturdays, Sundays and other holidays.

Variometer records :—The charts for the three Watson variometers are changed every alternate day, the records for two consecutive days being obtained on the same paper in the usual way.

Determination of scale coefficient :—The scale coefficients of the H.F. and V.F. magnetographs are obtained fortnightly from deflection observations performed on the instruments, with the deflector magnet at distances of 100 cms. and 120 cms. in the case of the H.F. magnetograph and at distances of 148.6 and 122.6 cms. in the case

of the V. F. magnetograph. The value of the scale coefficient adopted for any month for H.F. is the average of the mean observed value for that month and those of the preceding and succeeding months.

The scale co-efficient of the declination magnetograph has been determined once for all and is 1.03^1 per mm.

The scale coefficients of H.F. magnetograph in $\gamma/\text{cm.}$ for the months January—June 1950 are given below:—

| <i>Instrument</i> | <i>Jan.</i> | <i>Feb.</i> | <i>March</i> | <i>April.</i> | <i>May</i> | <i>June.</i> |
|-------------------|-------------|-------------|--------------|---------------|------------|--------------|
| H.F. magnetograph | 48.2 | 48.2 | 48.0 | 48.4 | 48.5 | 49.0 |

In the case of the V.F. instrument, a scale coefficient of $20 \gamma/\text{mm.}$ has been adopted for the first six months of 1950.

Temperature co-efficient of the magnetographs :—The diurnal range of temperature in the variometer room is 0.1°F. The annual range (summer maximum—winter minimum) is about 3.5°F. The temperature coefficients for the H.F. and V.F. magnetographs were determined by heating experiments. For this purpose the air temperature in the magnetograph room was raised by about 5°F by lamps and heaters and a series of temperature time readings were taken during the periods of rising and falling temperature. From the corresponding ordinates on the magnetograms the temperature coefficients were deduced in the usual way. The adopted value for the H.F. magnetograph is 32γ per degree F. This is rather a high value for temperature coefficient and is due to the fact that the H.F. magnet was locally made out of ordinary steel wire in the absence of a magnet of appropriate quality. This will, however, be replaced by a cobalt steel magnet which has recently been supplied by Messrs Cambridge Scientific Instrument Co. The temperature coefficient of the V.F. magnetograph was found to be negligible.

Base-line values.—(a) Base line values for H.F. are derived by converting the mean ordinates corresponding to absolute observation with Kew Magnetometer No. 3 in terms of gammas and subtracting these converted ordinates from the mean observed absolute horizontal force. They are further reduced to a uniform temperature of 65°F. to make the series comparable from month to month and year to year.

The adopted base line value for any week is the mean of seven values, all reduced to 65°F. including the given week as fourth of the seven. From this the base line values for the individual days of the week were determined after applying necessary temperature correction. This procedure was adopted, as certain absolute observations yielded results differing by 100 to 200 gammas for the three standard distances of 22.5, 30 and 40 cms of the deflecting magnet. The accuracy of the base line value derived from the above procedure is estimated to be $\pm 20 \gamma.$

(b) The base-line values for V.F. magnetograms are derived by expressing the mean ordinates of V.F. magnetograms at the time of inclination observations in terms of gammas and subtracting these from the values of vertical force obtained by multiplying the value of H.F. at that time by the tangent of inclination. The adopted values were derived in the same manner as for the H.F. magnetograms.

The performance of the V.F. instrument during the first three months of 1950 was unsatisfactory, resulting in loss of record on many days. The tabulation of V.F. for these three months is therefore omitted.

(c) While working out the statistics for declination, it was noticed that absolute measurements of declination made during 1950 were vitiated by considerable errors and therefore unsuitable for computation of the base-line value. It was fortunate, however, that no adjustment had been made in the D magnetograph since its initial set-up and therefore the base-line value could justifiably be taken to be constant. This circumstance permitted the utilisation of the base-line value determined with the required accuracy in 1951 for the purposes of tabulation of the data for the first half of 1950. The base-line value was derived by the usual procedure of converting the ordinate, corresponding to absolute observation with Kew Magnetometer No. 3, into angle and adding this to the corresponding observed absolute declination value. The value of the base-line, so obtained, is $3^\circ 14' .9$. The tabulated values of declination are correct to $\pm 0.5'$.

The optical arrangements for the three magnetographs are such that with the H and the V instruments an increase in the ordinate corresponds to an increase in the values of the elements; for the D magnetograph, however, an increase in the ordinate corresponds to a decrease in the westerly declination.

Basic hourly values and associated means.

Basic results.—Tables 1 to 15 contain hourly values of magnetic declination, horizontal intensity and vertical intensity. The hourly values from the magnetograms represent the average values, during one hour, centred at the full hours of G.M.T.

The columns headed 'maximum' and 'minimum' give the momentary extreme values of the element for each day.

Computed means :—At the bottom of each table are given the average hourly values obtained (i) for all days, (ii) for five international quiet days and (iii) for five international disturbed days.

Principal magnetic storms :—Magnetically a day is considered as (i) a quiet day (ii) a day of slight disturbance, (iii) a day of moderate disturbance, (iv) a day of moderate storm and (v) a day of great storm, depending on the ranges and the oscillations in the magnetograms. At Kodaikanal, a day is provisionally being taken as one of great storm if the range in H is above 400 γ, (ii) of moderate storm if the range is between 251 γ and 400 γ and (iii) of moderate disturbance, if the range lies between 150 γ and 250 γ. The range is, however, not the only criterion used in assigning the character of a storm.

Table No. 16 gives a list of principal magnetic storms recorded during the first half of 1950.

KODAIKANAL,

| June 29 | 08 18 | 30 09 | s.c. | ... | +22 | ... | m | 30 | 7 | 178 | 18 | |

(1) Approximate time of ending of storm construed as the time of cessation of reasonably marked disturbance movements in the traces.

(2) s.c.=sudden commencement; ... = (gradual commencement.)

(3) Signs of amplitudes of 'D' and 'Z' taken algebraically; (D—reckoned negative being westerly.

Z—reckoned positive being vertically downwards.)

(4) Storm described by three degrees of activity: (m)—for moderate when range in H is between 150 γ and 250 γ .(ma)—for moderately severe when range is between 251 γ and 400 γ .(s)—for severe when range is above 400 γ .
