

## RADIAL VELOCITIES OF 19 G, K-, AND M-TYPE STARS

M. B. K. SARMA

Centre of Advanced Study in Astronomy, Osmania University, Hyderabad 500 007

(Received 1975 May 20)

The present list of Radial Velocities for 19 stars obtained from 35 Mount Wilson and Palomar Spectrograms is a continuation of the list given by Abhyankar (1964) and Sarma (1967). In deriving the radial velocity from a plate, two independent systems of lines were taken. One system in the ultraviolet region from 3700 Å to 3900 Å consisted of twenty-two lines of Fe I and the other system in the visual region from 4000 Å to 4500 Å consisted of twenty-one lines mostly of Fe I except 4034.49 Å of Mn I. The standard lines chosen for the radial velocity measurements and the method of measurement are the same as those given by Abhyankar (1964). The explanation for observed differences in radial velocities derived from U. V. System and Visual System is given by Abhyankar (1963).

Table 1 gives the dates of observation of the plates (Mid Time of exposure) and helio-centric radial velocities. The helio-centric correction to the radial velocity  $V_{\odot}$  and the difference  $\Delta V_r$  (Visual-Ultraviolet) are also given in col. 5 and 8 respectively of the same table. The average internal probable error of each measurement is  $\pm 0.27$  km/sec. in U. V. System and  $\pm 0.25$  km/sec. in the Visual System.

Table 2 contains star number and name, spectral type, the value of Radial Velocity as given in General Catalogue of Stellar Radial Velocities (Wilson 1953) and the mean helio-centric radial velocity in U. V. and Visual Systems obtained from the present study.

Table 1

Star HD No. and Name	Plate and Exposure	Date	J.D. 2400000+	$V_{\odot}$ km/sec	Hel. Rad. Vel. in km/sec		$\Delta V_r$ (Vis. —U.V.) System
					U.V. System	Visual System.
